### Experiment No.08

**Aim:-** To implement backward chaining algorithm using python.

**Program:**

1. Write a program using backward chain Algorithm for the given case study.

Given data is the Goal State = frog or canary. Apply inference rules and reach the initial state.

**Code:**

```
database=["Croaks","Eat Flies","Shrimps","Sings"]  
knowbase=["Frog","Canary"]  
color=["Green","Yellow"]
```

```
def display():  
    print("\n X is \n1.Frog \n2.Canary ",end="")  
    print("\n Select One ",end="")  
def main():  
    print("*----- Backward Chaining -----*", end="")  
    display()  
    x=int(input())  
    print(" \n",end="")  
    if x==1:  
        print("Chance Of Eating Flies ",end="")  
    elif x==2:  
        print("Chance Of Shrimping ",end="")  
    else:  
        print("\n---- Invalid Option Selected -----",end="")  
    if x>=1 and x<=2:  
        print("\n X is ",end="")
```

```
print(knowledge[x-1],end="")
print("\n1.Green \n2.Yellow")
k=int(input())
if k==1 and x==1:
    print(" Yes it is in ",end="")
    print(knowledge[0],end="")
    print(" color and will ",end="")
    print(knowledge[0])
elif k==2 and x==2:
    print(" Yes it is in ",end="")
    print(knowledge[1],end="")
    print(" color and will ",end="")
    print(knowledge[2])
else:
    print("\n----- Invalid Knowledge Database ",end="")
if __name__=="__main__":
    main()
```

**Output:**

```
*----- Backward Chaining -----*
X is
1.Frog
2.Canary
Select One 1

Chance Of Eating Flies
X is Frog
1.Green
2.Yellow
1
Yes it is in Green color and will Croaks
```
